

Utilizing Information and Communication Technology to Prevent Violence Against Children in Uganda

From the study, it was evident that children have access to ICT devices. While ownership was low (39.5% were found to own mobile phones, 8% owned television sets and 7% laptop computers), access was high as over 75% had access to at least one ICT device. The most commonly accessed ICT device was the mobile phone, accessed by 78% of children, followed by radio (74%), television (68%) and laptop computers (29%).
